ABSTRACT OF THE DISCLOSURE

photosensitive invention relates to а The composition of the polymerisable resin type, the hardening polymerisation and/or which occurs by means of characterised in comprising: - initiating reticulation, means for at least one chain polymerisation reaction to hardening of said composition guarantee the sufficient quantity of at least one bifunctional monomer, photolabile centre with at least comprising a photolabile entity and at least two polymerisable units, connected by covalent skeletons to said photolabile centre cleavage sites of said located from the and away photolabile centre, such that said composition loses the integrity and adhesivity thereof under the influence of a reticulating radiation causing the cleavage of photolabile sites. The composition is particularly of application in dentistry.
